

Master Blueprint Approved Scheduling Decisions

Preferred covered reading edition

GOVERNING SCOPE | DG-01 THROUGH DG-03 APPROVED

Updated phase status and scheduling rules precede preserved master

Aesthenda Core v2.2 Scheduling Amendment

Status: APPROVED GOVERNING AMENDMENT

Effective: September 7, 2026

Decisions: DG-02 Option A and DG-03 Option B, with approved minimal overlap presentation.

This amendment controls booking-hold duration, manual hands-on exceptions, and their calendar presentation wherever earlier records differ. DG-01 remains in force. Other product scope and approval boundaries remain unchanged.

Fixed booking holds

All businesses use a fixed ten-minute booking hold, timed by the server from hold creation. There is no business, Service, or Appointment duration setting. Release early on explicit cancel/close; otherwise expire automatically. Confirmation revalidates the hold and current scheduling state; an expired hold cannot confirm from stale client state.

Professional overlap exceptions

Public booking never offers or confirms a non-fitting hands-on overlap. The authenticated owner-professional may manually book it after a specific warning and explicit confirmation bound to the exact request and current affected revisions. Published policy alone cannot authorize a hands-on conflict. Record the warning, actor, time, affected Appointments and segments, policy version, confirmation, and outcome. Preserve the full booked duration unless the professional explicitly edits it; never silently shorten work or move an existing appointment.

Minimal calendar presentation

Shade only the exact conflicting interval amber on both affected appointments, keeping their normal colors elsewhere. Show the same highlight while placing or moving the appointment, before the confirmation warning, and retain it after approval while the conflict exists. Use no persistent overlap label or extra icon. Tap or click reveals the overlap duration, affected appointments, and approval details. Provide the same details through keyboard interaction and screen-reader text without adding visible clutter.

Approved example

With zero buffers and other rules satisfied, a 10:00-10:15 application, 10:15-10:45 released processing segment, and 10:45-11:30 haircut permit a fitting 30-minute public service in the processing gap. A 45-minute service at 10:15 ends at 11:00 and is not offered publicly. A manual booking previews amber from 10:45 to 11:00 on both appointments, warns of the 15-minute overlap, and requires Book anyway before saving. Go back returns to editing without committing. Approval preserves the 45-minute booking and existing haircut timing.

Superseded requirements

- Master and Phase 3 business-configurable booking holds are replaced by the fixed ten-minute platform rule.
- An absolute prohibition against overlapping the professional's hands-on segments is replaced by an explicit manual exception. Public booking always blocks this conflict, regardless of published overlap policy.
- Phase 4 return-time fit rules apply to public and normal-fit booking; manual exceptions follow the confirmed-warning path. All Phase 4 Resource tracking language remains superseded by DG-01.
- Phase 5 language allowing published policy to permit hands-on overlap does not authorize an automatic exception. The professional must confirm each exact conflict.
- Phase 7 displays exact amber conflict intervals with details on demand. Persistent overlap labels and extra icons are excluded. Exact color tokens remain a Phase Eight styling decision within this approved behavior.

Current phase status

Phase	Status after propagation
1 Domain	Finalized baseline; DG-01 through DG-03 closed.
2 UX	Finalized baseline; DG-01 through DG-03 closed.
3 Business rules	Finalized baseline; DG-01 through DG-03 closed.
4 Architecture	Approved in practice; approved scheduling amendment controls the preserved review package. Full final regeneration remains outstanding.
5 Database	Internally approved; scheduling amendment clarifies persistence and exception constraints.
6 API actions	P6-D01 through P6-D10 approved by handoff; scheduling amendment extends the contracts. Full consolidated specification remains outstanding.
7 UI	Review draft. D01 and D02 approved; D03 and D04 partially resolved here. Seven decision items still require some review.

This table supersedes the older master phase-status entries for Phases 1-7. Later phases retain their previous planned or deferred status. Design decisions do not authorize production implementation or launch.

Master Blueprint DG-01 Amendment

Governance - Approved Amendment

APPROVED GOVERNING AMENDMENT

v1 uses Professional-calendar and Service-segment concurrency only

Decision: Defer Resource scheduling from v1

Status: APPROVED GOVERNING AMENDMENT

Effective: September 7, 2026

Amends: AESTHENDA CORE v2.2 Master Blueprint dated August 31, 2026

1. Controlling decision

Aesthenda v1 does not track, reserve, assign, or validate rooms, chairs, stations, waiting areas, equipment, named Resources, Resource pools, or Resource capacity. The independent professional manages these outside Aesthenda.

v1 scheduling and intentional overlap use only:

- the Professional's calendar and Availability;
- active and processing Service/Appointment segments;
- whether each segment occupies or releases the Professional;
- before/after buffers;
- travel time when enabled;
- existing Appointments and Calendar Blocks;
- booking holds;
- the configured maximum concurrent clients;
- the effective overlap policy and authorized exception rules.

Resource scheduling may be reconsidered after v1 only through a separately approved product, domain, architecture, database, action, UI, testing, and launch-readiness change.

2. Superseded master-blueprint language

This amendment supersedes the following v1 implications wherever they appear in the August 31, 2026 master and its capability addendum:

Master location	Superseded implication	Approved v1 replacement
Phase 1 - Domain Design	Resource is a conditional v1 entity.	Resource scheduling/capacity is deferred beyond v1. It is not a required or conditional v1 entity.
Phase 2 - User Experience	Resource tracking and same/alternate/waiting-area capacity models are supported in v1.	v1 has no Resource setup, assignment, reservation, calendar layer, availability input, conflict, or validation UX.
Phase 3 - Business Rules	The business controls processing-resource use in v1.	The business controls Professional occupancy during processing. Physical Resource use remains outside Aesthenda v1.
Intentional Double-Booking addendum	Availability and calendar presentation evaluate required Resources and Resource occupancy.	Availability and calendar presentation evaluate only Professional-calendar and Service-segment concurrency.
Blueprint Effects - Phase 1	Represent Resource capacity.	Represent overlap eligibility, timed segments, and Professional occupancy/release; do not model Resource capacity.
Blueprint Effects - Phase 3	Define Resource capacity limits.	Define Professional-calendar fit, segment fit, concurrent-client limits, warnings, and audit rules.
Blueprint Effects - Phase 5	Persist Resource capacity.	Persist timed segments, Professional occupancy/release, overlap policy, concurrent-client limits, and exception evidence only.
Blueprint Effects - Phase 7	Show station/Resource occupancy.	Show simultaneous Appointments, active/processing segments, and the next required hands-on segment; no Resource layer.

3. Phase-specific binding effects

Phase 1 - Domain Design

- Remove Resource from the v1 required/conditional entity inventory.
- Service Segment Definition records only timing and Professional occupancy/release for scheduling purposes.

- Appointment and Calendar Block reserve Professional-calendar time, not physical Resource capacity.
- Location may remain an optional delivery context with address, instructions, time zone, Availability, and travel behavior; it does not imply room/equipment scheduling.

Phase 2 - User Experience

- Do not ask the professional to configure physical Resources.
- Do not show Resource availability, assignment, occupancy, capacity, conflict, warning, or override controls.
- Intentional overlap remains first class through active/processing segments, next hands-on return, Professional Availability, and concurrent-client policy.

Phase 3 - Business Rules

- Public and professional slot decisions exclude room, chair, station, waiting-area, equipment, pool, and Resource-capacity data.
- A Service has no v1 physical-Resource requirement.
- An Appointment has no v1 physical-Resource assignment or reservation.
- No Resource-capacity error, exception, audit record, or client disclosure is generated in v1.
- The Professional remains responsible for confirming outside Aesthenda that the physical workspace/equipment can support any intentional overlap.

Phases 4-7

- P5-D04 is confirmed as the governing v1 data boundary.
- Phase 6 remains correct that there are no v1 Resource actions or Resource fields in slot/Appointment contracts.
- Phase 7 must remove any v1 Resource configuration or occupancy screens while preserving segment-based overlap presentation.

4. Decision log addition

D-018: Aesthenda v1 does not track, reserve, assign, or validate rooms, chairs, stations, waiting areas, equipment, Resource pools, or Resource capacity. The independent professional manages these outside the system. v1 overlap uses Professional-calendar and Service-segment concurrency only.

This decision supersedes v1 application of D-010 and the Resource/capacity portions of the approved capability addendum. D-010 may remain as a post-v1 exploration, but it is not an implementation requirement or implied capability for v1.

5. Acceptance test

The v1 domain, schema, action, UI, and test inventories must contain no Resource entity/table, physical-Resource field, Resource assignment/reservation, Resource availability/capacity rule, or Resource conflict/error path. Service segments, Professional occupancy/release, configured concurrent-client limits, and auditable overlap decisions remain intact.

Amendment effect: DG-01 is closed. DG-02 and DG-03 remain separate unresolved decisions and are not changed by this amendment.

AESTHENDA CORE

v2.2 Master Blueprint

The configurable operating system for independent beauty and wellness professionals

ONE PROFESSIONAL. ONE BUSINESS. ONE BOOKING BRAIN.

Document status

Working master blueprint. Phases -1 through 3 form the approved product foundation. Phases 4 through 11 define the planned execution framework and require phase-specific approval before implementation. Phase 12 remains deferred growth.

Controlling principle

Aesthenda adapts to the professional's business model. Operational policies are configurable, clearly communicated to clients, consistently enforced across every booking channel, and controlled by the business.

Version date: August 31, 2026

Blueprint Status

Phase	Name	Status	Next authority gate
-1	Lessons Learned	Approved foundation	Maintain as decisions evolve
0	Vision & Product Definition	Approved foundation	Validate with target professionals
1	Domain Design	Approved alignment	Expand into detailed domain specification
2	User Experience Blueprint	Approved alignment	Validate journeys and settings language
3	Business Rules	Approved policy model	Finalize detailed rule catalog
4	System Architecture	Planned	Approve boundaries and technology choices
5	Database Architecture	Planned	Approve schema and isolation design
6	API & Action Design	Planned	Approve action contracts
7	UI Blueprint	Planned	Approve screen flows and states
8	Design System	Planned	Approve visual foundations
9	Development Roadmap	Planned	Approve milestones and release criteria
10	Testing	Planned	Approve test matrix
11	Production Readiness	Planned	Approve launch checklist
12	Continuous Intelligence & Growth	Deferred	Activate only after v1 quality gate

Interpretation

Planned means the blueprint defines the work and its acceptance gate; it does not mean the design or implementation has been approved. This prevents architectural assumptions from quietly becoming product commitments.

Phase -1 - Lessons Learned

STATUS: APPROVED FOUNDATION

Capture what earlier planning and prototypes taught Aesthenda so those lessons remain visible during design and implementation.

Established direction

- Preserve strong booking concepts, client-centered workflows, professional branding, history, notes, reminders, waitlists, analytics, and intelligent assistance.
- Avoid team and front-desk complexity in v1.
- Never duplicate business rules in pages, bots, mobile clients, or integrations.
- Treat AI and integrations as controlled architectural participants, never alternate sources of truth.
- Make operating policies configurable instead of forcing one salon model.

Required deliverables

- Living lessons log
- Superseded-assumption register
- Decision history with rationale

Review gate

Can every major design choice explain which lesson it preserves or which prior mistake it prevents?

Phase 0 - Vision & Product Definition

STATUS: APPROVED FOUNDATION

Define what Aesthenda is before defining how it is built.

Established direction

- Mission: remove administrative friction and strengthen client relationships for independent beauty and wellness professionals.
- v1 serves one independent professional and their clients.
- No front desk, employee roster, staff hierarchy, team scheduling, or salon-management workflow in v1.
- Product character: upscale, sleek, modern, calm, expressive, and easy to operate during a busy day.
- Core principles: API-first, AI-ready, mobile-ready, secure, private, auditable, human-controlled, and brand-flexible.
- User-facing language uses professional and your business; technical modularity must not leak team complexity into the experience.

Required deliverables

- Validated target-customer profile
- Competitive positioning
- Measurable v1 success outcomes
- Product vocabulary
- Explicit non-goals

Review gate

Can an independent professional immediately understand who Aesthenda is for, why it feels different, and how it adapts to their business?

Phase 1 - Domain Design

STATUS: APPROVED ALIGNMENT

Model the independent business directly while preserving stable boundaries for future expansion.

Established direction

- Required entities: Professional, Business Account, Client, Service, Appointment, Availability, Calendar, Business Profile, Booking Page, Notification, Payment, Invoice, Policy Configuration, Audit Event, Consent / Communication Preference, and Integration Connection.
- Conditional entities: Location, Resource, Appointment Item, Calendar Block, and Agent / Automation Identity.
- Deferred entities: employees, staff roles, team assignment, commissions, memberships, gift cards, stored-value ledgers, and advanced packages.
- Multiple services and timed segments may exist inside one appointment; multiple professionals are deferred.
- One primary location is the simple default. Mobile, virtual, and additional locations are optional.

Required deliverables

- Detailed definitions for every required and conditional entity
- Lifecycle/state diagrams
- Relationships and ownership
- Tenant/account scope
- Audit and retention requirements
- Domain invariants

Review gate

Can every required v1 entity be justified by the daily operation of one independent professional?

Phase 2 - User Experience Blueprint

STATUS: APPROVED ALIGNMENT

Deliver a personal business cockpit that becomes powerful progressively without turning setup into enterprise administration.

Established direction

- Launch path: add a service, set availability, add essential brand information, review policy recommendations, preview, and publish.
- Primary professional surfaces: Today, Calendar, Clients, Services, Availability, Booking Page, Payments, Communications, Analytics, Settings, Assistant, Integrations, and Activity.
- Client surfaces: service discovery, real-time availability, booking, appointment management, forms/consent, payment, and history where enabled.
- Advanced settings use progressive disclosure and plain language.
- Resource tracking is optional; same-station, alternate-station, waiting-area, and untracked processing models are supported.
- User-facing AI may ship after core workflows even though the architecture is AI-ready from the start.

Required deliverables

- End-to-end professional and client journey maps
- Navigation and information architecture
- Screen-state specifications
- Policy settings experience
- Accessibility requirements
- Usability validation plan

Review gate

Can the professional publish quickly, operate the day confidently, and customize policy without encountering unnecessary complexity?

Phase 3 - Business Rules

STATUS: APPROVED POLICY MODEL

Keep business behavior consistent across every channel while allowing the professional to control how their business operates.

Established direction

- The business controls processing-resource use, buffers, same-day booking, notice, booking horizon, cancellation, deposits, rescheduling, no-show response, booking holds, and travel time.
- Initial recommendations are visible and editable; they are not universal Aesthenda policy.
- Zero minutes is the starting buffer posture.
- The owner-professional may override a scheduling overlap where safe after seeing consequences; overrides are auditable and never disguised as conflict-free.
- Security, account isolation, transaction integrity, processor constraints, and law remain non-configurable platform boundaries.
- Existing appointment terms retain the policy version applied when the appointment was confirmed.

Required deliverables

- Complete rule identifiers and definitions
- Policy-resolution hierarchy
- Override matrix
- Client-disclosure rules
- Error/explanation catalog
- Rule test cases

Review gate

Would the same request receive the same decision from every interface using the professional's effective saved policy?

Phase 4 - System Architecture

STATUS: PLANNED - REQUIRES APPROVAL

Define engines and boundaries so interfaces never own business logic.

Established direction

- A modular monolith is the preferred starting posture unless measured scale or isolation needs justify additional services.
- Core engines: Identity & Account, Policy, Scheduling, Appointment, Client, Booking, Payment, Notification, Reporting, Audit, Integration, Automation, and Agent Orchestration.
- Aesthenda is canonical. UI, mobile, AI, voice, and integrations invoke the same application actions.
- Agents receive scoped capabilities and cannot access the database directly.
- External processors remain authoritative only for their own settlement or delivery facts; Aesthenda reconciles those facts into canonical business records.

Required deliverables

- System context and container diagrams
- Engine responsibility matrix
- Sync/async interaction map
- Authentication and authorization design
- Failure and retry strategy
- Observability architecture
- Technology decision records

Review gate

Can any interface be replaced without rewriting scheduling, payment, client, or policy logic?

Phase 5 - Database Architecture

STATUS: PLANNED - REQUIRES APPROVAL

Translate the domain into an isolated, auditable, evolvable data model.

Established direction

- Every protected record is scoped to a business account directly or through a provable parent relationship.
- Use database constraints for invariants that must survive application bugs.
- Use RLS or equivalent enforcement as defense in depth, not as the sole authorization layer.
- Appointment, payment, policy, consent, and audit history preserve the facts that were true at the time.
- Soft deletion is selective; immutable financial and audit facts are never silently erased.

Required deliverables

- Conceptual and physical ERDs
- Table/column specification
- Keys, constraints, indexes, and exclusion rules
- Account-isolation and RLS policies
- Migration and rollback strategy
- Retention, archival, and deletion matrix
- Backup and restore objectives

Review gate

Can tests prove that one professional's protected business and client data cannot leak into another account?

Phase 6 - API & Action Design

STATUS: PLANNED - REQUIRES APPROVAL

Make one business action equal one controlled implementation.

Established direction

- Initial actions include create/move/cancel/complete appointment, create/merge client, calculate slots, update availability, publish booking page, record client note, collect/record/refund payment, update policy, and send/resend communication.
- Every action authenticates, resolves business scope, authorizes, validates, applies policy, executes transactionally, audits, and returns a structured response.
- Writes use idempotency and explicit conflict handling.
- Actions return stable machine-readable error codes plus safe human explanations.
- Read models may be optimized per surface, but writes never bypass canonical actions.

Required deliverables

- Action catalog
- Request/response schemas
- Authorization matrix
- Error taxonomy
- Idempotency rules
- Versioning and compatibility policy
- Webhook/event contracts
- API examples and contract tests

Review gate

Can every consequential operation be safely invoked by UI, mobile, AI, voice, or an authorized integration without duplicating logic?

Phase 7 - UI Blueprint

STATUS: PLANNED - REQUIRES APPROVAL

Turn approved journeys and actions into complete screen behavior before implementation.

Established direction

- Mobile-first professional navigation centers Today, Calendar, Clients, and a fast create action.
- Secondary areas include Services, Booking Page, Payments, Communications, Analytics, Settings, Integrations, Assistant, and Activity.
- Every screen defines first-use, empty, loading, saved, success, validation, system error, offline, conflict, no-availability, payment, permission, expired-action, and recovery states where applicable.
- The interface shows effective policy and where it came from.
- Warnings explain consequences; they do not use vague red banners as a substitute for information.

Required deliverables

- Complete screen inventory
- Low-fidelity flows
- Responsive layouts
- Interaction and state specifications
- Content/copy system
- Accessibility annotations
- Prototype for usability testing

Review gate

Can the professional understand what happened, why it happened, and what to do next without learning system terminology?

Phase 8 - Design System

STATUS: PLANNED - REQUIRES APPROVAL

Create a premium visual and interaction system that supports professional branding without sacrificing usability.

Established direction

- Aesthenda's shell remains recognizable while the public booking page expresses the professional's brand.
- Design qualities: refined, calm, spacious, modern, warm, and operationally clear.
- Accessibility is built into tokens and components, including contrast, focus, reduced motion, text scaling, and touch targets.
- Financial, policy, warning, automation, and audit states use consistent semantic treatments.

Required deliverables

- Typography scale
- Color and semantic tokens
- Spacing and layout grid
- Core component library
- Iconography
- Motion principles
- Responsive behavior
- Booking-page theming boundaries
- Conversational UI patterns
- Accessibility specification

Review gate

Does Aesthenda feel upscale and personal while remaining effortless to operate under time pressure?

Phase 9 - Development Roadmap

STATUS: PLANNED - REQUIRES APPROVAL

Build a complete independent-professional vertical slice in increments that can be demonstrated and tested.

Established direction

- Milestone 1 - Foundation: identity, business account, professional profile, audit skeleton, and policy storage.
- Milestone 2 - Bookable Core: services, availability, scheduling engine, appointments, and calendar.
- Milestone 3 - Client Launch: clients, booking-page designer, public booking, cancellation, and rescheduling.
- Milestone 4 - Money & Communication: Square, deposits, checkout, refunds, external payment recording, confirmations, and reminders.
- Milestone 5 - Operational Quality: forms, consent, reporting, observability, accessibility, security, and performance.
- Milestone 6 - Controlled Intelligence: integration engine, scoped agent foundation, conversational workflows, then mobile expansion.

Required deliverables

- Dependency graph
- Milestone acceptance criteria
- Release slices
- Risk register
- Resourcing and estimates
- Feature-flag strategy
- Definition of done

Review gate

Does each milestone deepen one coherent product and produce a demonstrable, testable outcome without premature team complexity?

Phase 10 - Testing

STATUS: PLANNED - REQUIRES APPROVAL

Test rules and trust boundaries as thoroughly as visible screens.

Established direction

- Unit tests cover policy and domain decisions.
- Integration tests cover database constraints, transactions, processors, notifications, and action contracts.
- Scheduling tests cover concurrency, processing segments, resources, overrides, time zones, and daylight-saving transitions.
- Security tests cover authorization, account isolation, RLS, sensitive logging, secrets, and abuse controls.
- Agent tests prove ambiguous intent requires clarification and automation cannot exceed granted authority.
- User acceptance testing uses independent professionals and realistic working-day scenarios.

Required deliverables

- Traceability matrix from rules to tests
- Automated test suites
- Test data strategy
- Performance targets
- Accessibility audit
- Security assessment
- UAT plan and acceptance record
- Release regression suite

Review gate

Can Aesthenda demonstrate that human and automated actions obey the same rules, permissions, isolation, and audit requirements?

Phase 11 - Production Readiness

STATUS: PLANNED - REQUIRES APPROVAL

Make launch safe, observable, recoverable, and supportable.

Established direction

- Structured logs and traces use correlation IDs without exposing sensitive client data.
- Dashboards cover booking health, action errors, payment reconciliation, notification delivery, integration health, and automation activity.
- Backups and restore procedures are tested, not merely configured.
- Feature flags and kill switches can stop automated actions without disabling core manual workflows.
- Incident response identifies actor, action, policy, request, external dependency, and resulting state.

Required deliverables

- Production launch checklist
- Monitoring and alerting
- Backup/restore evidence
- Runbooks and incident plan
- Secrets and key rotation
- Rate limits and abuse protection
- Support documentation
- Privacy and legal review
- Rollback plan
- Launch approval record

Review gate

If a human, integration, or automated action goes wrong, can Aesthenda identify it, explain it, stop it, and recover safely?

Phase 12 - Continuous Intelligence & Growth

STATUS: DEFERRED UNTIL v1 QUALITY GATE

Expand only after the independent-professional experience is excellent and operationally trustworthy.

Established direction

- Potential growth: advanced AI receptionist, business copilot, waitlist filling, scheduling optimization, personalized rebooking, voice ecosystems, native mobile, developer ecosystem, and forecasting.
- Potential organizational expansion: multiple professionals, staff roles, front desk, multi-location management, commissions, and enterprise controls.
- Growth continues through canonical actions, shared rules, explicit permission, business isolation, policy configuration, and auditable execution.
- New capabilities must remain optional and must not make the core experience feel heavier.

Required deliverables

- v1 quality threshold
- Validated demand evidence
- Growth opportunity assessment
- Capability-specific privacy and risk review
- Expansion roadmap and backward-compatibility plan

Review gate

Can Aesthenda grow without sacrificing the simplicity, adaptability, and trust that make the independent-professional product valuable?

Decision Log - v2.2

ID	Decision
D-001	v1 serves one independent beauty or wellness professional and their clients.
D-002	Team, employee, front-desk, and staff-management workflows are deferred.
D-003	Professional is the user-facing term; technical terms must not leak team complexity.
D-004	Aesthenda adapts to the business; operational policies are configurable.
D-005	Recommended starting values are not universal operating mandates.
D-006	Aesthenda remains the canonical source of business truth.
D-007	One booking brain serves web, mobile, AI, voice, and integrations.
D-008	AI and automation may not bypass actions, policies, permissions, or audit.
D-009	Service buffers begin at zero minutes unless the business changes them.
D-010	Processing resource use supports same station, alternate station, waiting area, or no tracked resource.
D-011	The owner-professional may override safe scheduling conflicts with explicit warning and audit.
D-012	One primary location is the simple default; additional location models are optional.
D-013	A user-facing AI assistant may follow the core release even though architecture is AI-ready from inception.
D-014	Phases 4-11 require phase-specific approval before implementation.
D-015	Phase 12 activates only after the v1 quality gate is met.

Immediate Next Step

Begin Phase 4 as a reviewable architecture package: system context, engine boundaries, action flow, authentication and authorization model, failure strategy, observability model, and technology decision records. Do not begin database or UI implementation until the Phase 4 review gate is approved.

Approved foundation references

- AESTHENDA CORE v2.1 Master Blueprint
- Entity Definitions v2.1 Alignment Review
- Independent Professional UX v2.1 Alignment Review
- Business Rules v2.1 Alignment Review

Approved Product Capability Addition

These capabilities are part of the product foundation and supersede any earlier wording that treats double-booking as only an exception or booking-page branding as a minor optional setting.

1. Intentional Double-Booking

Aesthenda must make intentional double-booking easy for professionals whose service model supports it. The professional should not have to manipulate service durations, create fake blocks, or work around the calendar to fit compatible clients together.

- Double-booking is a configurable scheduling mode, not merely an emergency conflict override.
- The professional may enable it globally, for selected services, for selected processing segments, or case by case.
- Availability calculation can deliberately offer overlapping times when the saved rules show the professional and required resources are available.
- The calendar visually stacks simultaneous appointments and shows active work, processing time, station/resource occupancy, and the next required hands-on segment.
- A fast add-to-overlap action shows exactly why the appointment fits or what will conflict before confirmation.
- The professional retains authority to approve a safe overlap; Aesthenda records the decision and does not disguise a known conflict.
- Aesthenda never forces double-booking. The professional can disable it completely.

2. Booking-Page Customization

After the professional enters the information required to become bookable, Aesthenda offers a guided customization step before preview and publication.

- Choose a curated theme or style direction.
- Customize brand colors, background and accent treatments, typography/font pairings, buttons, cards, and visual density within supported boundaries.
- Add a logo, professional image, cover imagery, business description, and other approved brand assets.
- Preview changes live in mobile and desktop booking-page views.
- Provide polished starting themes so customization feels expressive without requiring design expertise.
- Maintain accessibility through contrast checks, legible typography, keyboard behavior, reduced-motion support, and protected transactional states.
- Brand styling changes presentation only; services, prices, policies, availability, payments, and booking behavior continue to use canonical Aesthenda data and actions.

Blueprint Effects

Phase	Required effect
Phase 1	Represent overlap eligibility, processing segments, resource capacity, and booking-page theme configuration.
Phase 2	Add intentional overlap workflows and a guided Customize Your Booking Page step before preview/publication.

Phase	Required effect
Phase 3	Define double-booking policy resolution, availability behavior, capacity limits, warnings, and audit rules.
Phase 4	Place overlap calculation in Scheduling and branding configuration behind canonical application boundaries.
Phase 5	Persist overlap policy, timed segments, resource capacity, theme tokens, assets, and published configuration versions.
Phase 6	Add calculateOverlappingSlots(), createOverlappingAppointment(), updateBookingTheme(), previewBookingPage(), and publishBookingPage().
Phase 7	Design stacked calendar views, overlap indicators, quick-add flow, theme editor, and responsive live preview.
Phase 8	Define curated themes, safe token ranges, font catalog, brand controls, and accessibility enforcement.
Phases 9-11	Include both capabilities in roadmap acceptance criteria, tests, monitoring, documentation, and launch readiness.

Additional decisions

- D-016: Intentional double-booking is a first-class, configurable scheduling capability.
- D-017: Professionals can customize the look and feel of their public booking page after completing essential business setup.
